**Abstract:** This paper investigates the mechanical characteristics and failure modes of dolomite. The dynamic triaxial compression tests of dolomite specimens under three-dimensional loading and axial impact were conducted by using the modified three-dimensional split Hopkinson pressure bar (SHPB) apparatus. The influence of axial pressure, confining pressure and strain rate on strength, deformation modulus and energy absorption of dolomite was analyzed. The strain rate effect of the coupled static-dynamic loading of rock was discussed. The test results show that: when the confining pressure is constant and the axial static pressure increases, the compressive strength of rock increases at first and then decreases while the deformation modulus decreases; the energy absorption per unit volume first increases and then decreases with the increasing of axial pressure. The failure pattern of dolomite is compression-shear under three-dimensional coupled dynamic and static loading.

**Key words:** dolomite ; mechanical characteristics ; failure mode ; strain rate effect ; dynamic strength increase factor ; energy transfer
